Why landfills?

Potential sources of pollution

- migration pathways in the subsurface
- source-pathway-receptor model

Methane emissions and climate change

- Landfills are main contributor (40%) to UK methane release
- Methane is 21 times more powerful than CO₂ as a greenhouse gas
- They are a significant factor in UK reduced emission targets

Outline

Principally considering subsurface electrical conductivity

- It's a 'new information' data set
- Ignoring main geological discoveries (regional scale)
- Concentrating on environmental information at scale of ~1 to 3 km
- Simple mapping information and subsurface volumetric information

From geophysical perspective (without technical site-information)

- 1 active quarry
- 1 sewage works
- 5 landfills

subsurface electrical conductivity depends on:

Geology

Geology (solid component)

- porosity (i.e. void space)
- mineralogical associations (e.g. clays)

Pore water geochemistry

- ionic concentration & mobility
- (e.g. Na^+ , SO_4^- , Cl^- , K^+ , and NO_3^- groups)
- No geochemical discrimination...
- it measures only Total Dissolved Solids

Pore fluids

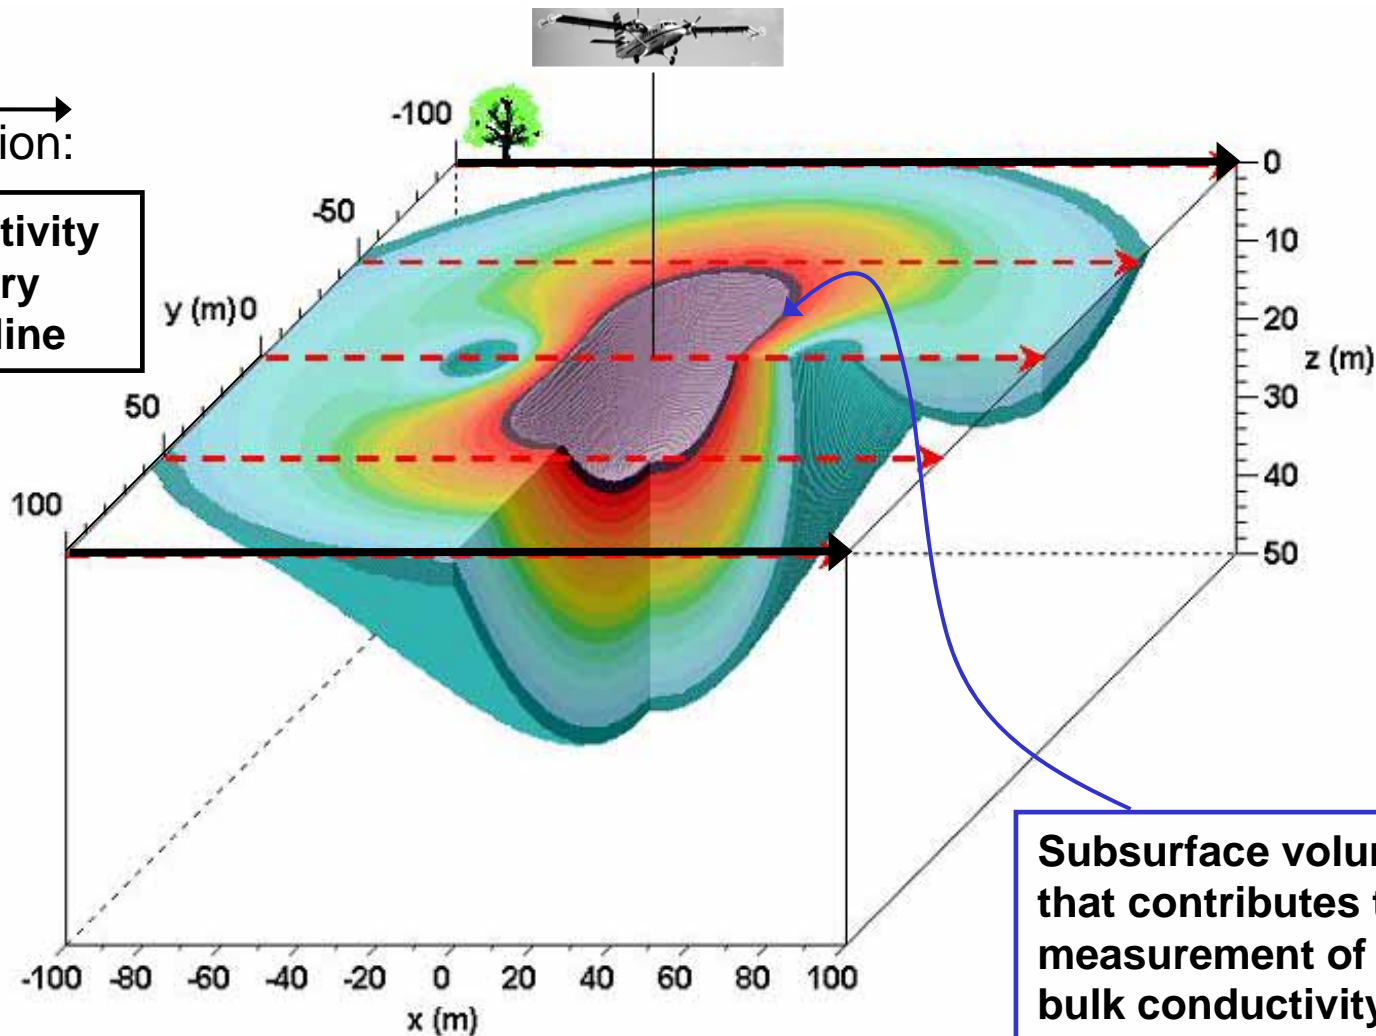

Demonstrating the electromagnetic footprint

Flight direction:

Bulk conductivity
sampled every
~15m along line

Subsurface volume
that contributes to
measurement of
bulk conductivity

■ conductivity > 25 mS/m in black

■ conductivity > 50 mS/m in red

■ cut at coast

Conductivities
> 5 mS/m

Yellow =
deepest

Study area
2x2 km

Target sewage works (north of Killeter)

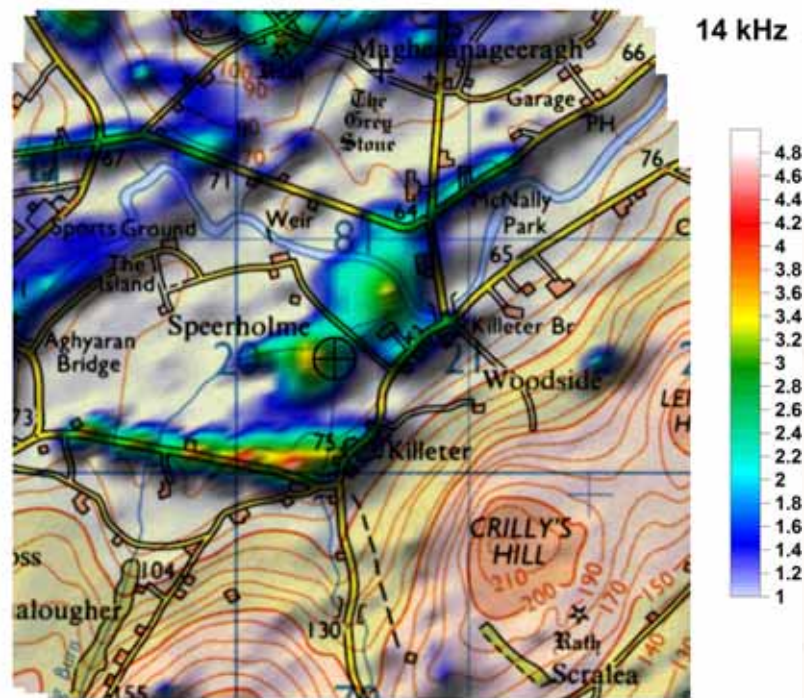

Demonstrating low amplitude conductivity mapping (1 to 5) 3x3 km

Apparent conductivity (mS/m) 1 to 5 mS/m 3x3 km
Sewage works (symbol) in centre

deeper

Apparent conductivity (mS/m) 1 to 5 mS/m 3x3 km
Sewage works (symbol) in centre

shallower

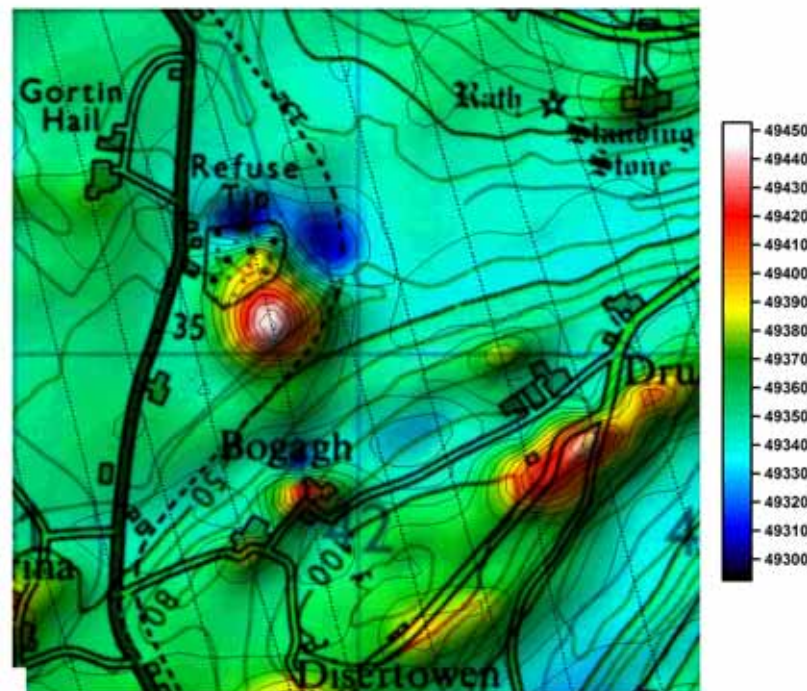

Study area
2x2 km

Demonstrating landfill anomaly confined to ~1 flight line

Conductivity > 2 mS/m

Magnetic field

Strabane : Refuse tip
adjacent to river Finn/border

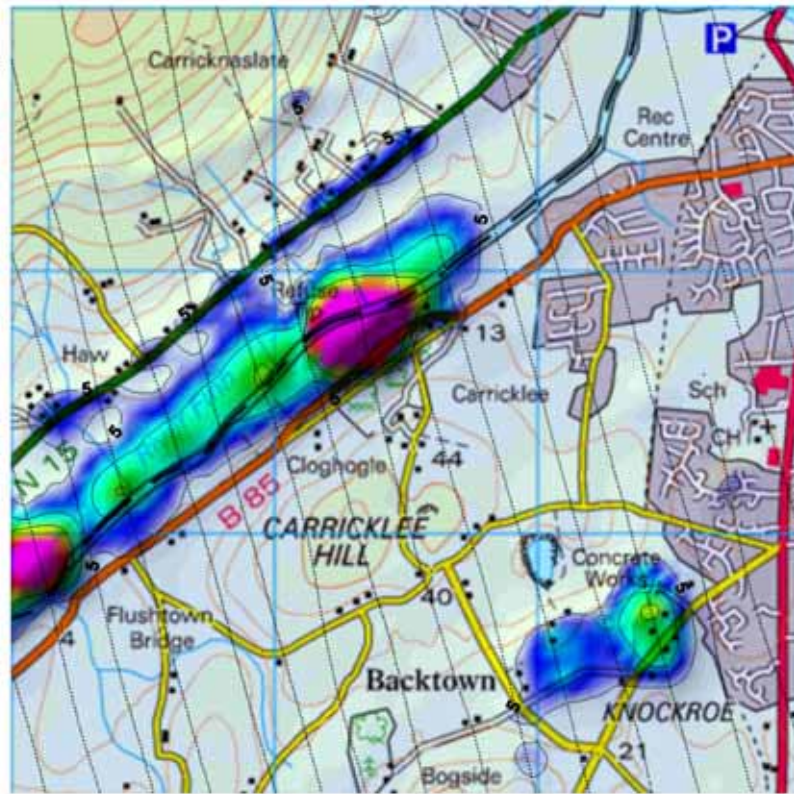

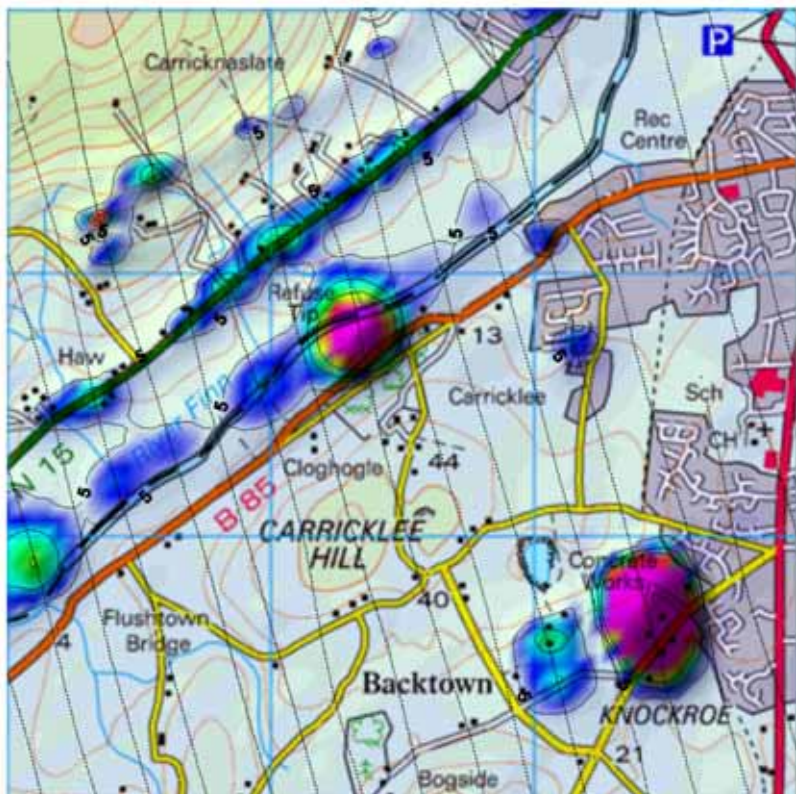

Strabane : concrete works

Study area
3x3 km

Demonstrating landfill anomaly with extensive plume

deeper

shallower

Study area
4x4 km

Demonstrating more extensive landfill anomaly with high conductivity

conductivity

Power-line monitor

Demonstrating volumetric subsurface (to 40 m) information

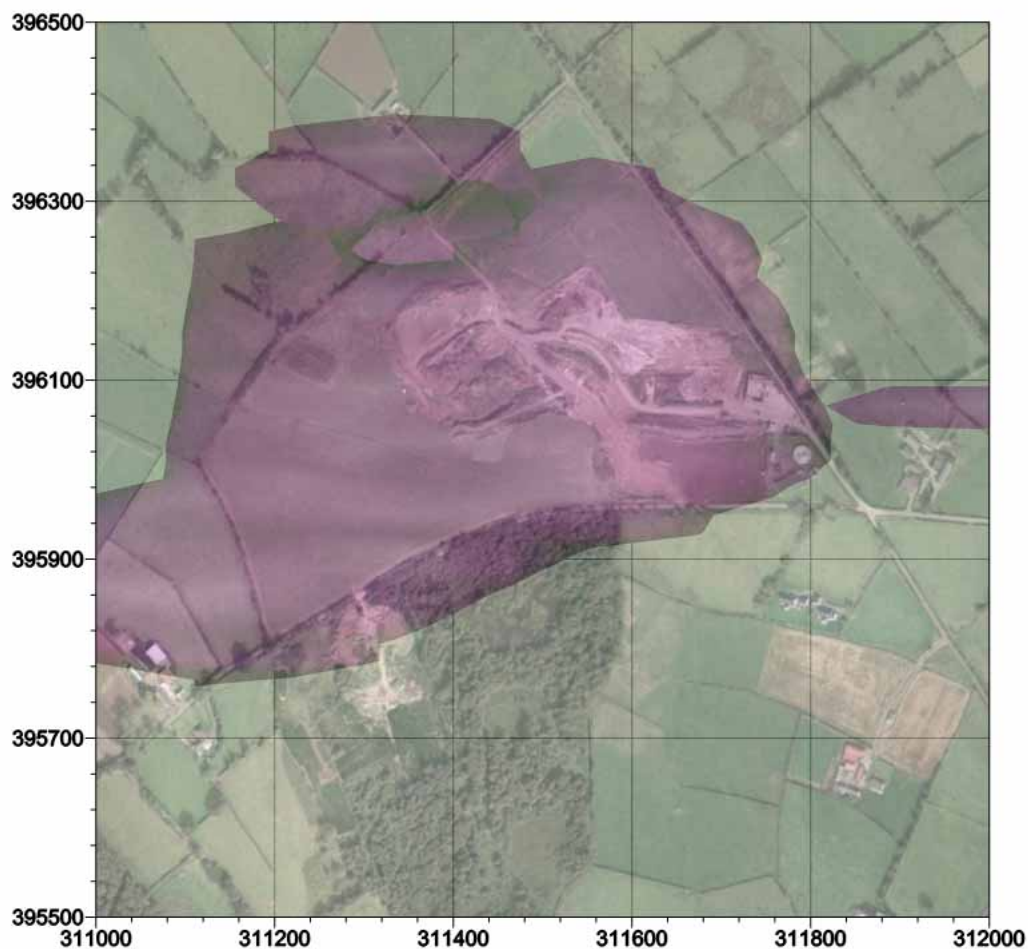

LF44 1 x 1 x 0.04 km
Conductivity isovolumes

Demonstrating the 3D conductivity distribution beneath the site

Study area
1x1 km

> 80 mS/m

Demonstrating subsurface conductivities $> 55 \text{ mS/m}$ (to 30 m)

Study area
3x2 km

Craigahullier landfill,
operating since 1998,
occupying a former quarry

Demonstrating an engineered landfill in a complex setting

Study area
3x2 km

Largest landfill conductivities encountered (young reactive site)

3D perspective view of conductivity

Detail. Largest amplitude response (pink contours)
and line of cross-section

2 km conductivity cross-section across landfill

Demonstrating regional scale of saline intrusion and likely geological control

Study area
7x7 km

Hightown/Belfast Hills Landfill

Conceptual hydrogeological flow model

(Site Conditioning Plan Report/Site Permit,
White Young Green for Macwill Services Ltd)

Demonstrating conductivity mapping at shallowest frequency

Belfast Hills Landfill
1.5 x 1.5 km looking north-east

AEM shallow apparent conductivity (25kHz)
200m flight line sampling (dots)

Conductivities > 20 mS/m
5 cell construction in red

Demonstrating conductivity iso-surface > 55 mS/m, slices to 80 m depth

Summary

To a degree I've have been showing you the data with a view to addressing the **environmental** question:

- ◆ What's in my back-yard ? Or more correctly....
- ◆ What's under my back-yard ?
- ◆that can be a sensitive question
- ◆ From a safe perspective, it may be best to treat the airborne data (at the site-scale) as 'pathfinder' information
- ◆ It is 'new' information and takes time/effort to digest
- ◆ The data, inevitably, tend to pose questions that require further understanding and follow-up studies
